“ Now, when users call with a problem, we are able to address the problem faster as we have detailed hardware and software inventory ”

We have a fairly large IT environment with more than 3000 assets spread across different departments. We did not have a complete view of the assets we did not know the assets types we had and who owned them. When users emailed us with a problem we had to call them back to check the machine name and get more details. It was really time consuming and tedious for users as well as technicians.

AssetExplorer automatically discovered assets in our network and gave us a clear picture of different types of assets in our organization. It helped us to understand all the asset details and who owned them. Now, when users call with a problem, we are able to address the problem faster as we have detailed hardware and software inventory. Software License Management helped us to group licensed software and define policies for Free, Open Source, and prohibited software. AssetExplorer helped us gain complete control and manage all the assets.
